Vegas Tap-To-Pay Experience

Think of the experience below in the same way you swipe a card at an arcade.

Users will be prompted to activate their card by creating a Mezo account. Upon creation, they'll be credited with \$10 MUSD, which can be redeemed at the Mezo booth for purchases of Coffee, swag/merch items, massage, IV, and more.

Core User Flows

1. Happy Path: RFID Tap-to-Pay (Primary)

1. User receives Mezo-branded **RFID card** with:
 - An **RFID chip**
 - A unique **QR code**
 - A **printed UID** (e.g., `04:A2:BB:1C:99`)
2. User scans **QR** → lands on a **page**, e.g., `mezo.org/vegasbaby/UID_123`
3. User enters:
 - **Email**
 - **Desired Mezo ID** for reservation (check availability from DB — handled on Mezo side)
4. On submit:
 - Card is **activated**
 - DB updated with:

```
{
  "card_uid": "04:A2:BB:1C:99",
  "mezo_id": "johnnybtc",
  "email": "user@xyz.com",
  "balance": 5,
  "is_active": true,
  "last_used_at": null
}
```

1. User visits a **vendor booth**
2. Vendor has:
 - RFID reader OR
 - Manual input field for **UID** (if RFID fails)
3. POS app fetches data by UID → allows **tap or type** → shows balance → vendor clicks redeem

2. Fallback Flow: QR or Manual Entry Only

If **RFID doesn't work**, card still works with:

- **Printed UID** on the card

- QR leads to a universal page: `mezo.org/vegasbaby`
- User types in UID → completes activation

At booth:

- Vendor **types in UID manually** if reader is down or user only has UID on hand

Technical Requirements

1. Universal Landing Page (`mezo.org/vegasbaby`)

- Responsive, mobile-first
- Automatically recognizes UID (via unique QR code)
- Also can have card number field entered: **Enter Card Number (UID)**
- Validates:
 - UID format (simple regex like `^[0-9A-F: ]+$`)
 - UID not already activated
- Email + Mezo ID entry
 - Check Mezo ID availability (Mezo handles this)
 - On submit: write to DB
- Success screen: "You're Activated!"

2. POS Web App (Vendor Interface)

- Platform: Web app (React preferred) running on laptop/tablet
- Two input modes:
 - a. **RFID Scan** (via USB reader like `ACR122U`)
 - b. **Manual Entry** of printed UID
- Shows:
 - Mezo ID
 - Balance
 - Buttons: "Coffee (1 MUSD)", "Massage (3 MUSD)", "Hoodie (5 MUSD)"
- Handles:
 - Deducts balance
 - Shows remaining
 - Blocks over-redemption
 - Error state if UID not found
